

## A new species of *Charletonia* from Iran

(Acari, Erythraeidae)

Samaneh Tashakor, Hamidreza Hajiqanbar, Alireza Saboori & Masoud Hakimitabar

Tashakor, S., Hajiqanbar, H., Saboori, A. & Hakimitabar, M. 2015. A new species of *Charletonia* from Iran (Acari, Erythraeidae). *Spixiana* 38(2): 197–201.

*Charletonia baluchestanica* Tashakor & Hakimitabar spec. nov. (Acari: Trombidiformes: Erythraeidae) is described and illustrated based on larvae ectoparasitic on *Ochrilidia* sp. (Orthoptera: Acrididae) in Sistan and Baluchestan province, eastern Iran. The mites were attached to basal fore- and hindwings, dorsal surface of the abdomen and also tympanum of the host.

### Introduction

The genus *Charletonia* (Acari: Parasitengona: Erythraeidae) was established by Oudemans, 1910. To date, about 74 species of this genus with more than two setae between coxae II and III have been described. To the present, 13 species of larval *Charletonia* have been reported from Iran as follows: *C. krendowskyi* (Feider 1954); *C. saboorii* Karimi Iravanlou, Kamali & Talebi, 2002; *C. nazaleae* Karimi Iravanlou, Kamali & Talebi, 2002; *C. damavandica* Karimi Iravanlou, Kamali & Talebi, 2002; *C. ahwazensis* Haitlinger & Saboori, 2007; *C. mehranensis* Haitlinger & Saboori, 2007; *C. behbahanensis* Haitlinger & Saboori, 2008; *C. bojnordensis* Haitlinger & Saboori, 2008; *C. talebii* Sedghi, Saboori & Hakimitabar, 2010; *C. stekolnikovi* Hakimitabar & Saboori, 2011; *C. shahriari* Saboori, Azimi & Shirdel, 2012; *C. dalegori* Haitlinger, 2003; *C. terianae* Hakimitabar, Saboori & Seiedy, 2013; *C. behshahriensis* Hakimitabar & Saboori, 2014; *C. farajii* Noei, Saboori & Hajizadeh, 2015 (Karimi Iravanlou et al. 2002, Haitlinger & Saboori 2007, 2008, Sedghi

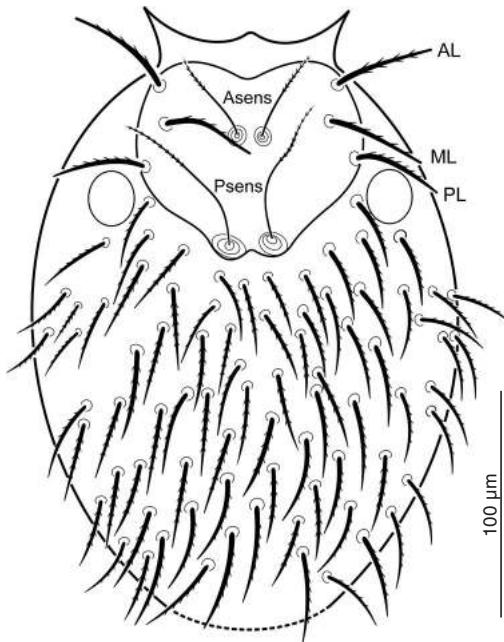

et al. 2010, Hakimitabar & Saboori 2011, Ahmadi et al. 2012, Saboori et al. 2012, Hakimitabar et al. 2013, Hakimitabar et al. 2014, Noei et al. 2015).

Among them, seven species have four setae between coxae II & III. In this paper, we describe and illustrate the larva of *Charletonia baluchestanica* spec. nov. associated with its locust host, *Ochrilidia* sp. (Orthoptera: Acrididae).

### Materials and methods

Mites were collected from one specimen of *Ochrilidia* sp. (Orthoptera: Acrididae) and host captured using an insect net. Mites were detached by an insect pin and preserved in 75 % ethanol. The mites were cleared in lactophenol and mounted in Hoyer's medium.

Morphology of the mites was studied using a phase contrast microscope (Olympus BX51, Tokyo, Japan). All measurements in the description are given in micrometers. Terminology and abbreviations follow those of Saboori et al. (2009) and Wohltmann et al. (2007).

**Fig. 1.** *Charletonia baluchestanica* Tashakor & Hakimitabar spec. nov. (larva). Dorsal view of idiosoma.

*Charletonia baluchestanica*  
Tashakor & Hakimitabar spec. nov.  
Figs 1-9

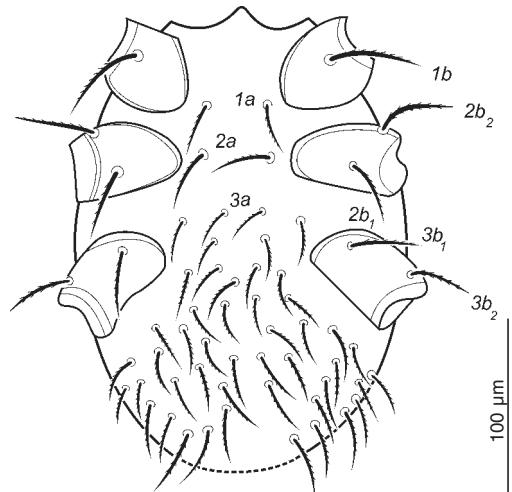

**Diagnosis.** Larva with the following features: four setae between coxae II and III, Ti III < 150, solenidion on Ge I proximal to most distal normal seta.

**Description (n=7)**

Idiosoma 244–580 long, 184–380 wide. Dorsal surface with 79–86 (fD) barbed and blunted setae; one eye on each side of idiosoma, 25 in diameter; scutum punctate and wider than long; anterior margin slightly convex in lateral parts and concave in median part, lateral borders slightly convex; posterior border concave except around Psens bases which is slightly convex; scutum with two pairs of sensilla and three pairs of normal setae (Fig. 1).

AL, ML and PL barbed and blunted and approximately equal in length. Anterior sensilla (Asens) shorter than posterior sensilla (Psens), both barbed in distal half.

Ventral surface of idiosoma with 36–43 (fV) pointed setae with fine barbs. Sternalae 1a (between coxae I), 2a (between coxae II); 3a (between coxae III) barbed and pointed; four setae between coxae II and III, similar to sternalae. NDV=79+43=122 holotype, NDV=119–129 paratypes. Coxa I with one

**Fig. 2.** *Charletonia baluchestanica* Tashakor & Hakimitabar spec. nov. (larva). Ventral view of idiosoma.

barbed and pointed seta (1b); coxae II and III each with two barbed setae which 2b<sub>2</sub>, 3b<sub>2</sub> are blunted and 2b<sub>1</sub>, 3b<sub>1</sub> are pointed. Supracoxal seta of leg I peg like, 4 long (Fig. 2).

Leg segmentation formula: 7-7-7. Leg setal formula: Leg I: Ta-1 $\omega$ , 1 $\epsilon$ , 2 $\zeta$ , 1Cp, 29n; Ti-2 $\phi$ , 1 $\kappa$ , 1Cp, 18n (17 in one paratype); Ge-1 $\sigma$ , 1 $\kappa$ , 12n; TFe-5n, BFe-4n; Tr-1n. Leg II: Ta-1 $\omega$ , 2 $\zeta$ , 30n; Ti-2 $\phi$ , 19n; Ge-1 $\kappa$ , 12n; TFe-5n, BFe-4n; Tr-1n. Leg III: Ta-1 $\zeta$ , 30n; Ti-1 $\phi$ , 19n; Ge-12n; TFe-5n, BFe-2n; Tr-1n (Fig. 3-8).

Dorsal surface of legs punctate whereas ventral surface is sparsely punctate.

IP = 527 + 511 + 568 = 1606 holotype, IP = 1536–1602 paratypes.

Subcapitulum with a barbed galeala (Ga), and two hypostomiae, anterior one (aHy) nude and posterior (pHy) one barbed and pointed. Galeala (31) almost with the same length as posterior hypostomiae (33). Palpal femur and genu each with one barbed and pointed seta; palpal tibia with three barbed and pointed setae; palpal tibial claw bifid. Palp tarsus with four barbed and one nude setae, an eupathidium and a solenidion. fPp=0-B-B-BB<sub>2</sub>-BBBBN $\omega$  $\zeta$ . Cheliceral basis and subcapitulum punctate. Cheliceral blade with a subterminal tooth. Supracoxal seta peg-like (eP), 4 long (Fig. 9).

Measurements are given in Table 1.

**Remarks.** This species belongs to the species group of *Charletonia* with four setae between coxae II–III, solenidion placed in distal half of Ge I and proximal to the most distal normal seta. This group includes two species: *C. ghanensis* Haitlinger, 2007 from Ghana and *C. zorani* Haitlinger, 2004 from Croatia. It differs

**Types.** The holotype (HH 2012-21) and 6 paratypes (HH 2012-21 P1–P6) were collected from *Ochrilidia* sp. (Orthoptera: Acrididae), 10 February 2011, by H. Hajiqanbar in Bampoor region, Iranshahr city, Sistan and Baluchestan province. The parasitic larvae were attached to basal fore- and hindwings, dorsal surface of the abdomen and also in tympanum of the host. The holotype, 3 paratypes and host insect are deposited in the Acarological Collection, College of Agriculture, Tarbiat Modares University, Tehran, Iran, two paratypes in the Acarological Collection, Zoological Museum, College of Agriculture, University of Tehran, Karaj, Iran, and one paratype in the Acarological Collection, Acarological Society of Iran, Department of Plant Protection, Faculty of Agriculture, University of Tehran, Karaj, Iran.

### Acknowledgements

We thank Dr. H. Hojat (researcher at Jalal Afshar Zoological Museum, Department of Plant Protection, Faculty of Agriculture, University of Tehran, Karaj, Iran) for the identification of the acridid insect host. This research was partly funded by a grant (No. 88001046) from the ‘Iran National Science Foundation’ and partly from the ‘Office of vice president for research affairs, Tarbiat

Modares University, Tehran, Iran’ which is greatly appreciated.
